...

Herbaceous plants in botany, frequently shortened to herbs, are vascular plants that have no persistent woody stems above ground. Herb has other meanings in cooking, medicine, and other fields. Herbaceous plants are those plants that

do not have woody stems. This includes many perennials, and nearly all annuals and biennials. Herbaceous plants include graminoids, forbs, and ferns.

Phenotypic plasticity is considered to play a major role in determining the success of many invasive plants (Nicotra et al. 2010; Pyšek and Richardson 2007; Richards et al. 2006), by affecting both the short-term response of plant populations to environmental variation and their long-term persistence (Matesanz et al. 2012).

We studied 138 herbaceous species to explore the implications of body size variation from the “plant's eye view”—that is, with body size measured not just as dry mass, but also in terms

that more directly reflect what the plant experiences, and the space that it occupies, within its local neighborhood: its fresh mass, height, and maximum lateral canopy extent, area, and volume.
